                                                                                                        The invention describes a novel method of identifying viral DNA of human papililomavirus (HPV) in cellular material collected from an individual. The method comprises extracting DNA from the cellular material, amplifying the DNA by using a polymerase, and identifying sequences of the HPV genome using an identifying reagent. The presence of HPV in cells is now based on identification of a nucleotide sequence in the II identify the presence of HPV virus in every stage of infection and to distinguish between virus strains having low hazard and virus strains region of middle-high hazard. This is the primer used to identify the E6 hazard HPV strains in infected cells, described in

The invention relates to a method for preparing a stabilised reaction CC mixture which contains at least one enzyme and which is at least CC maixture which contains at least one enzyme and which is at least CC mixture which containing an enzyme and a three-component stabiliser CC solution mixture containing an enzyme and a three-component stabiliser CC solution mixture containing an enzyme and a three-component stabiliser CC three-component stabiliser solution used in the method comprises an CC agent which protects against dessication, an inhibitor of condensation CC groups, and an inert polymer that forms a mesh structure that inhibits the method comprises and CC acid manipulations such as amplification, sequencing, hybridisation CC used as "ready-to-use" mixtures for performing a wide range of nucleic and/or restriction analysis, e.g., for the diagnostic detection of CC and/or restriction analysis, e.g., for the diagnostic detection of CC and/or restriction analysis, e.g., for the diagnostic detection of CC components needed to perform a particular reaction, already deposited in CC areaction vessel, which eliminates the need for multiple additions crepeatability and reliability. The dried reaction, thereby improving transported and stored at ambient temperature without significant loss of activity, and are suitable for "not start" reactions. Sequences CC amplify regions of human papillomavirus (HPV) genomes in order to characterise their type. Primers ABZ75142-ABZ75143 are PCR primers used CC characterise their type. Primers ABZ75143 are used to amplify a 250 bp

                                                                                                                      The present invention relates to complexes between Saccharomyces cerevisiae Selected Interacting Domain (SID (RTM)) proteins and coding sequences. The protein complexes of S. cerevisiae are useful in drug development, in screening drugs or agents that modulate the interaction of proteins, for developing yeast strains with better secretion yield of protein, and in gene therapy. The protein complexes, polypeptides and polynucleotides are useful for preventing or treating Candida infection, cancer or neurodegenerative diseases in humans or animals. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The probe i

                                                                                                                                                                                                                                                                                                                                      The invention relates to a complex between two interacting Saccharomyces cerevisiae polypeptides, comprising two Selected Interacting Domain (SID polypeptides as bait and prey proteins. A pharmaceutical composition comprising the complex is useful for preventing or treating Candida infection, cancer and neurodegenerative diseases in a human or animal, preferably in a mammal. This sequence represents DNA encoding a SID

The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned.

New isolated nucleic acid representing a synthetic Bax gene, useful as medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in certain diseases

Claim 36; Figure 1; 344pp; English.

This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Bax-resistant yeast or fungi, identifying, or obtaining and identifying. identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors or inhibitor sequences of Bax-induced cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The isolated nucleic acids, polypeptides, pharmaceutical compositions, antisense molecules and antibodies are useful as medicaments or in preparing a medicament for treating, preventing and/or alleviating diseases associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease.

In humans, this may lead to death of CC white blood cells, which causes severe immunodeficiencies. The AMP CC deaminase and adenosine deaminase may be used to prepare antibodies CC to these proteins, and to design or identify herbicides that inhibit CC their enzyme activities. The polynucleotides are used as probes for CC genetically and physically mapping genes, where such information may be CC markers for traits linked to those genes, where such information may be CC used in plant breeding to develop lines with desired phenotypes. The CC nucleic acid fragments may be used to isolate CDNAs and genes encoding CC homologous proteins from the same or other plant species, and in CC polymerase chain reaction (PCR) protocols to amplify longer nucleic CC acid fragments encoding homologous genes from DNA or RNA. These may CC also be used to create transgenic plants in which the polypeptides are overexpressed or suppressed, and as probes in direct fluorescent in situ hybridisation (PISH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The present invention relates to the genomic sequence of Pyrococcus abyssi and P. abyssi proteins (see ARB9603-ARB96842). P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. abyssi. The 5' end of this sequence overlaps with the 3' end of AAH41226
                                                                                                                Claim

ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and

tumours of ovarian or

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "

All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M University BAC Center University. College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zea mays
